EDUCATION

College of Staten Island

Masters of Science in Computer Science

- Focus: Artificial Intelligence, Network and Cyber Security

Staten Island, NY

August 2025 – Present

State University of New York at New Paltz

Bachelors of Science in Computer Engineering

- Relevant Coursework: Software Engineering, Computer Science III, Data Structures, Computer Architecture

New Paltz, NY

August 2023

TECHNICAL SKILLS

Languages: Java, SQL, JavaScript, Python, C/C++, XML, Verilog, Assembly, HTML/CSS

Other Tools: PyTorch, NumPy, tKinter, Pandas, Spring, Javalin, Mockito, JDBC, Maven

Developer Tools: GitHub, Visual Studio, MySQL, Anaconda, Eclipse, Jupyter Notebook, Blink Arduino

WORK EXPERIENCE

CUNY CSI | Title: Help Desk Assistant

January 2026 – Present

- Assist students and faculty with technical issues.
- Balance incoming phone calls with in-person queries from users and effectively remedy all issues in a timely manner.
- Must communicate quickly, effectively and professionally.

Stellantis | Title: Validation Engineer

September 2023 – July 2024

- Validated and troubleshooted the functionality of electronic components within new models of electric vehicles by reading and interpreting the signals across the communication networks.
- Responding to errors documented by other engineers and conducting a root-cause analysis to determine the reason for system's failures.
- Troubleshooted electrical circuits, components and systems and created solutions for other engineers.
- Wrote in-depth reports detailing the errors, the causes and possible solutions for another team of engineers to fix.

PROJECTS

AI Loan Default Prediction | AI, Python, CatBoost, LightGBM, XGBoost

November 2025

- A Kaggle competition where, using a dataset of user's bank data, the goal is to predict whether or not a borrower will pay back their loan.
- Created and tuned an ensemble including CatBoost, LightGBM and XGBoost to improve the accuracy of generalized predictions.
- Finished in the top quartile of over 3,000 teams.

Minesweeper Solver Application | Python, NumPy, tKinter

October 2025

- Created an application in Python to detect the state of a minesweeper game and solve for all possible squares.
- Used a brute-force approach to detect all unknown squares within the grid that are adjacent to all known squares and calculate whether it is a bomb, clear square or unknown. Then update the board for new information and repeat the process until the entire board is completed.
- Used the tKinter library to create a visual and interactive board to play the game.

Social Media Messenger Application | Java, SQL, Spring Boot, Javalin

April 2025

- Designed the back-end for a social media messaging platform that can handle user sign-ups, logins and the sending/receiving of messages.
- Used Spring Boot to properly inject dependencies and SQL to create databases for the accounts and messages.
- Designed the data access object, the service layer and controller layers from scratch using tools like Javalin.
- Configured the endpoints to be compliant with RESTful API architecture and implemented basic anti-injection security.

TRAINING

Software Engineering Training: Completed training course for back-end application development using Java and SQL and using frameworks such as Javalin and Spring. Trained by Revature.
